

(b) End-of-run versions and retained bytes

48 threads · N=1M · Zipf 0.9 · 10 ops · 3 s; external GC 10/100 μs; unlink without reuse

Correctness checks passed; performance remains unverified diagnostic data (indeterminate ceiling). Missing: per-read hop denominator.

Stack = chain-resident + unlinked but unreused. Top: millions of versions / MiB; bottom: versions or bytes per installed version. Per-install = each run's final count or bytes divided by that same run's installed version count; count build 1 rep per arm. Missing cells: none.
