

(d) Interval GC cost in count runs

48 threads · N=1M · Zipf 0.9 · 10 ops · 3 s; external GC 10/100 μs; unlink without reuse

Correctness checks passed; performance remains unverified diagnostic data (indeterminate ceiling). Missing: per-read hop denominator.

stock minimum general

Install lock fraction = rdtscp wait cycles / clocks_per_us / 1e6 / (3 s × 48 threads), summed over threads.
Pruning: circle = attempts, square = success, triangle = lock failure; solid = minimum, dashed = general. Stock is not applicable (0 for reference). Count build 1 rep; missing cells: none.
