

(b) End-of-run versions and retained bytes

48 threads · N=1M · Zipf 0.9 · 10 ops · 3 s; external GC 10/100 μs; unlink without reuse

Normal arms passed; preregistered S8 positive unmet (positive 0, auxiliary detections 6, disqualified 0). Performance: unverified diagnostic data (indeterminate ceiling).

Stack = chain-resident + unlinked but unreused. Top: millions of versions / MiB; bottom: versions or bytes per installed version.
Per-install = final count or bytes / that arm's install count. Arm differences are confounded by install counts (write volume); each cell/arm count is alongside values at summary cells[cell][arm].retention.installed. Count build 1 rep; missing: none.
Verification: Normal arms passed; preregistered S8 positive unmet (positive 0, auxiliary detections 6, disqualified 0).
